

Mobile Application Development

Session 4 – Additional Exercises

1. jQuery Mobile Navigation

Add links from all level one pages in the Zedland Hotel app (e.g. #five, #four, etc.) to allow users to navigate *back* to the home page from these pages. All links should be in the header, before the page <h1> title. Use *data-icon="home"* to render the links as buttons. Also, add appropriate transitions between pages.

Now, add links from all level two pages (e.g. *churchill-hotel.html*, *fox-hotel.html*) back to the page immediately above them in the hierarchy (e.g. #five). All links should be in the header, before the page <h1> title. Again, use *data-icon="home"* to render the links as buttons. Again, add appropriate transitions between pages.

2. Reading

Explore the [jQuery Mobile Gallery](#). Study the sites there. Look at how the navigation has been put together. Are any approaches to navigation better than others? Are there any that do not work? Be critical. They are not all perfect.
